

On model structure for coreflective subcategories of a model category

Tadayuki Haraguchi

1 Introduction

Let \mathbf{C} be a coreflective subcategory of a cofibrantly generated model category \mathbf{D} . In this paper we show that under suitable conditions \mathbf{C} admits a cofibrantly generated model structure which is left Quillen adjoint to the model structure on \mathbf{D} . As an application, we prove that well-known convenient categories of topological spaces, such as k -spaces, compactly generated spaces, and Δ -generated spaces [3] (called numerically generated in [12]) admit a finitely generated model structure which is Quillen equivalent to the standard model structure on the category \mathbf{Top} of topological spaces.

2 Coreflective subcategories of a model category

Let \mathbf{D} be a cofibrantly generated model category [7, 2.1.17] with generating cofibrations I , generating trivial cofibrations J and the class of weak equivalences $W_{\mathbf{D}}$. If the domains and codomains of I and J are finite relative to I -cell [7, 2.1.4], then \mathbf{D} is said to be finitely generated.

Recall that a subcategory \mathbf{C} of \mathbf{D} is said to be coreflective if the inclusion functor $i: \mathbf{C} \rightarrow \mathbf{D}$ has a right adjoint $G: \mathbf{D} \rightarrow \mathbf{C}$, so that there is a natural isomorphism $\varphi: \text{Hom}_{\mathbf{D}}(X, Y) \rightarrow \text{Hom}_{\mathbf{C}}(X, GY)$. The counit of this adjunction $\epsilon: GY \rightarrow Y$ ($Y \in \mathbf{D}$) is called the coreflection arrow.

Theorem 2.1. *Let \mathbf{C} be a coreflective subcategory of a cofibrantly generated model category \mathbf{D} which is complete and cocomplete. Suppose that the unit of the adjunction $\eta: X \rightarrow GX$ is a natural isomorphism, and that the classes I and J of cofibrations and trivial cofibrations in \mathbf{D} are contained in \mathbf{C} . Then \mathbf{C} has a cofibrantly generated model structure with I as the set of generating cofibrations, J as the set of generating trivial cofibrations, and $W_{\mathbf{C}}$ as the class of weak equivalences, where $W_{\mathbf{C}}$ is the class of all weak equivalences contained in \mathbf{C} . If \mathbf{D} is finitely generated, then so is \mathbf{C} . Moreover, the adjunction $(i, G, \varphi): \mathbf{C} \rightarrow \mathbf{D}$ is a Quillen adjunction in the sense of [7, 1.3.1].*

Proof. It suffices to show that \mathbf{C} satisfies the six conditions of [7, 2.1.19] with respect to I , J and $W_{\mathbf{C}}$. Clearly, the first condition holds because $W_{\mathbf{C}}$ satisfies the two out of three property and is closed under retracts. To see that the

second and the third conditions hold, let $I_{\mathbf{C}}$ -cell and $J_{\mathbf{C}}$ -cell be the collections of relative I -cell and J -cell complexes contained in \mathbf{C} , respectively. Since $I_{\mathbf{C}}$ -cell and $J_{\mathbf{C}}$ -cell are subcollections of the collections of relative I -cell and J -cell complexes in \mathbf{D} , respectively, the domains of I and J are small relative to $I_{\mathbf{C}}$ -cell and $J_{\mathbf{C}}$ -cell, respectively. The rest of the conditions are verified as follows. Let $f: X \rightarrow Y$ be a map in \mathbf{C} . Since $\eta: X \rightarrow GX$ is isomorphic for $X \in \mathbf{D}$, f is I -injective in \mathbf{C} if and only if it is I -injective in \mathbf{D} . Similarly, f is J -injective in \mathbf{C} if and only if it is J -injective in \mathbf{D} . Let f be an I -cofibration in \mathbf{D} . Then it has the left lifting property with respect to all I -injective maps in \mathbf{C} . Hence f is an I -cofibration in \mathbf{C} . Conversely, let f be an I -cofibration in \mathbf{C} . Suppose we are given a commutative diagram

$$\begin{array}{ccc} X & \longrightarrow & A \\ f \downarrow & & p \downarrow \\ Y & \longrightarrow & B \end{array}$$

where p is I -injective in \mathbf{D} . Then there is a relative I -cell complex $g: X \rightarrow Z$ [7, 2.1.9] such that f is a retract of g by [7, 2.1.15]. Since g is an I -cofibration in \mathbf{D} , there is a lift $Z \rightarrow A$ of g with respect to p . Then the composite $Y \rightarrow Z \rightarrow A$ is a lift of f with respect to p . Therefore f is an I -cofibration in \mathbf{D} . Similarly, f is a J -cofibration in \mathbf{C} if and only if it is a J -cofibration in \mathbf{D} . Thus we have the desired inclusions

- $J_{\mathbf{C}}\text{-cell} \subseteq W_{\mathbf{C}} \cap I_{\mathbf{C}}\text{-cof}$,
- $I_{\mathbf{C}}\text{-inj} \subseteq W_{\mathbf{C}} \cap J_{\mathbf{C}}\text{-inj}$, and
- either $W_{\mathbf{C}} \cap I_{\mathbf{C}}\text{-cof} \subseteq J_{\mathbf{C}}\text{-cof}$ or $W_{\mathbf{C}} \cap J_{\mathbf{C}}\text{-inj} \subseteq I_{\mathbf{C}}\text{-inj}$.

Here $I_{\mathbf{C}}\text{-inj}$ and $I_{\mathbf{C}}\text{-cof}$ denote, respectively, the classes of I -injective maps and I -cofibrations in \mathbf{C} , and similarly for $J_{\mathbf{C}}\text{-inj}$ and $J_{\mathbf{C}}\text{-cof}$. Therefore \mathbf{C} is a cofibrantly generated model category by [7, 2.1.19].

It is clear, by the definition, that \mathbf{C} is finitely generated if so is \mathbf{D} .

Finally, to prove that (i, G, φ) is a Quillen adjunction, it suffices to show that $G: \mathbf{D} \rightarrow \mathbf{C}$ is a right Quillen functor, or equivalently, G preserves J -injective maps in \mathbf{D} by [7, 1.3.4] and [7, 2.1.17]. Let $p: X \rightarrow Y$ be a J -injective map in \mathbf{D} . Suppose there is a commutative diagram

$$\begin{array}{ccc} A & \longrightarrow & GX \\ f \downarrow & & Gp \downarrow \\ B & \longrightarrow & GY \end{array}$$

where $f \in J$. Then we have a commutative diagram

$$\begin{array}{ccccc} A & \longrightarrow & GX & \xrightarrow{\epsilon} & X \\ f \downarrow & & & & p \downarrow \\ B & \longrightarrow & GY & \xrightarrow{\epsilon} & Y. \end{array}$$

Since p is J -injective in \mathbf{D} , there is a lift $h: B \rightarrow X$ of f . Thus we have a lift $Gh \circ \eta: B \cong GB \rightarrow GX$ of f with respect to Gp . Therefore $Gp: GX \rightarrow GY$ is J -injective in \mathbf{C} . Similarly, we can show that G preserves I -injective maps in \mathbf{C} , and so G preserves trivial fibrations in \mathbf{C} . Hence (i, G, φ) is a Quillen adjunction. \square

We turn to the case of pointed categories [7, p.4]. Let \mathbf{D}_* be the pointed category associated with \mathbf{D} , and let $U: \mathbf{D}_* \rightarrow \mathbf{D}$ be the forgetful functor. We denote by I_+ and J_+ the classes of those maps $f: X \rightarrow Y$ in \mathbf{D}_* such that $Uf: UX \rightarrow UY$ belongs to I and J , respectively. Then we have the following. (Compare [7, 1.1.8], [7, 1.3.5], and [7, 2.1.21].)

Theorem 2.2. *Let \mathbf{D} be a cofibrantly (resp. finitely) generated model category, and let \mathbf{C} be a coreflective subcategory satisfying the conditions of Theorem 2.1. Then the pointed category \mathbf{C}_* has a cofibrantly (resp. finitely) generated model structure, with generating cofibrations I_+ and generating trivial cofibrations J_+ , such that the induced adjunction $(i_*, G_*, \varphi_*): \mathbf{C}_* \rightarrow \mathbf{D}_*$ is a Quillen adjunction.*

We also have the following Proposition.

Proposition 2.3. *Suppose \mathbf{C} and \mathbf{D} satisfy the conditions of Theorem 2.1. Suppose, further, that the coreflection arrow $\epsilon: GY \rightarrow Y$ is a weak equivalence for any fibrant object Y in \mathbf{D} . Then the adjunctions $(i, G, \varphi): \mathbf{C} \rightarrow \mathbf{D}$ and $(i_*, G_*, \varphi_*): \mathbf{C}_* \rightarrow \mathbf{D}_*$ are Quillen equivalences.*

Proof. Let X be a cofibrant object in \mathbf{C} and Y a fibrant object in \mathbf{D} . Let $f: X \rightarrow Y$ be a map in \mathbf{D} . Then we have $\varphi f = Gf \circ \eta: X \cong GX \rightarrow GY$. Since f coincides with the composite $X \xrightarrow{\varphi f} GY \xrightarrow{\epsilon} Y$ and ϵ is a weak equivalence in \mathbf{D} , φf is a weak equivalence in \mathbf{C} if and only if f is a weak equivalence in \mathbf{D} . It follows by [7, 1.3.17] that the induced adjunction (i_*, G_*, φ_*) is a Quillen equivalence. \square

3 On a model structure of the category \mathbf{NG}

In [12] we introduced the notion of numerically generated spaces which turns out to be the same notion as Δ -generated spaces introduced by Jeff Smith (cf. [3]). Let X be a topological space. A subset U of X is numerically open if for every continuous map $P: V \rightarrow X$, where V is an open subset of Euclidean space, $P^{-1}(U)$ is open in V . Similarly, U is numerically closed if for every such map P , $P^{-1}(U)$ is closed in V . A space X is called a numerically generated space if every numerically open subset is open in X .

Let \mathbf{NG} denote the full subcategory of \mathbf{Top} consisting of numerically generated spaces. Then the category \mathbf{NG} is cartesian closed [12, 4.6]. To any X we can associate the numerically generated space topology, denoted νX , by letting U open in νX if and only if U is numerically open in X . Therefore we have a functor $\nu: \mathbf{Top} \rightarrow \mathbf{NG}$ which takes X to νX . Clearly, the identity map $\nu X \rightarrow X$ is continuous. By the results of [7, §3] the following holds.

Proposition 3.1. *The functor $\nu: \mathbf{Top} \rightarrow \mathbf{NG}$ is a right adjoint to the inclusion functor $i: \mathbf{NG} \rightarrow \mathbf{Top}$, so that \mathbf{NG} is a coreflective subcategory of \mathbf{Top} .*

A continuous map $f: X \rightarrow Y$ between topological spaces is called a weak homotopy equivalence in \mathbf{Top} if it induces an isomorphism of homotopy groups

$$f_*: \pi_n(X, x) \rightarrow \pi_n(Y, f(x))$$

for all $n > 0$ and $x \in X$. Let I be the set of boundary inclusions $S^{n-1} \rightarrow D^n$, $n \geq 0$, J the set of inclusions $D^n \times \{0\} \rightarrow D^n \times I$, and $W_{\mathbf{Top}}$ the class of weak homotopy equivalences. The standard model structure on \mathbf{Top} can be described as follows.

Theorem 3.2 ([7, 2.4.19]). *There is a finitely generated model structure on \mathbf{Top} with I as the set of generating cofibrations, J as the set of generating trivial cofibrations, and $W_{\mathbf{Top}}$ as the class of weak equivalences.*

The category \mathbf{NG} is complete and cocomplete by [12, 3.4]. A space X is numerically generated if and only if $\nu X = X$ holds. Thus the unit of the adjunction $\eta: X \rightarrow \nu X$ is a natural homeomorphism. Moreover, since CW-complexes are numerically generated spaces by [12, 4.4], the classes I and J are contained in \mathbf{NG} . Let $W_{\mathbf{NG}}$ be the class of maps $f: X \rightarrow Y$ in \mathbf{NG} which is a weak equivalence in \mathbf{Top} . Since the coreflection arrow $\nu Y \rightarrow Y$, given by the identity of $Y \in \mathbf{Top}$, is a weak equivalence (cf. [12, 5.4]), we have the following by Theorem 2.1 and Proposition 2.3.

Theorem 3.3. *The category \mathbf{NG} has a finitely generated model structure with I as the set of generating cofibrations, J as the set of generating trivial cofibrations, and $W_{\mathbf{NG}}$ as the class of weak equivalences. Moreover the adjunction $(i, \nu, \varphi): \mathbf{NG} \rightarrow \mathbf{Top}$ is a Quillen equivalence.*

We turn to the case of pointed spaces. Let \mathbf{Top}_* be the category of pointed topological spaces. By [7, 2.4.20], there is a finitely generated model structure on the category \mathbf{Top}_* , with generating cofibrations I_+ and generating trivial cofibrations J_+ . Then we have the following by Theorem 2.2 and Proposition 2.3.

Corollary 3.4. *There is a finitely generated model structure on the category \mathbf{NG}_* of pointed numerically generated spaces, with generating cofibrations I_+ and generating trivial cofibrations J_+ . Moreover, the inclusion functor $i_*: \mathbf{NG}_* \rightarrow \mathbf{Top}_*$ is a Quillen equivalence.*

Remark. (1) The argument of Theorem 3.3 can be applied to the subcategories \mathbf{K} of k -spaces and \mathbf{T} of compactly generated spaces. Similarly, the argument of Corollary 3.4 can be applied to the pointed categories \mathbf{K}_* and \mathbf{T}_* . Compare [2.4.28], [2.4.25], [2.4.26] of [7].

(2) Let \mathbf{Diff} be the category of diffeological spaces (cf. [8]). In [12] we introduced a pair of functors $T: \mathbf{Diff} \rightarrow \mathbf{Top}$ and $D: \mathbf{Diff} \rightarrow \mathbf{Top}$, where T is a left adjoint to D , and showed that the composite TD coincides with

$\nu: \mathbf{Top} \rightarrow \mathbf{NG}$. Thus \mathbf{NG} can be embedded as a full subcategory into \mathbf{Diff} . It is natural to ask whether \mathbf{Diff} has a model category structure with respect to which the pair (T, D) gives a Quillen adjunction between \mathbf{Top} and \mathbf{Diff} .

Let I be the unit interval, and let $\lambda: \mathbf{R} \rightarrow I$ be the smashing function, that is, a smooth function such that $\lambda(t) = 0$ for $t \leq 0$ while $\lambda(t) = 1$ for $t \geq 1$. Let \tilde{I} denote the unit interval equipped with the quotient diffeology $\lambda_*(D_{\mathbf{R}})$, where $D_{\mathbf{R}}$ is the standard diffeology of \mathbf{R} . In [5] we introduce a finitely generated model category structure on \mathbf{Diff} with the boundary inclusions $\partial\tilde{I}^{n-1} \rightarrow \tilde{I}^n$ as generating cofibrations, and with the inclusions $\partial\tilde{I}^{n-1} \times \tilde{I} \cup \tilde{I}^n \times \{0\} \rightarrow \tilde{I}^n \times \tilde{I}$ as generating trivial cofibrations. Its class of weak equivalences consists of those smooth maps $f: X \rightarrow Y$ inducing an isomorphism $f_*: \pi_n(X, x_0) \rightarrow \pi_n(Y, f(x_0))$ for every $n \geq 0$ and $x_0 \in X$. Here, the homotopy set $\pi_n(X, x_0)$ is defined to be the set of smooth homotopy classes of smooth maps $(\tilde{I}^n, \partial\tilde{I}^n) \rightarrow (X, x_0)$.

It is expected that with respect to the model structure on \mathbf{Diff} described above, the pair (T, D) induces a Quillen adjunction between \mathbf{Top} and \mathbf{Diff} .

Acknowledgements.

I would like to express my sincere gratitude to my supervisor Kazuhisa Shimakawa. He introduced me to the project of building a homotopy theory on the category \mathbf{NG} . This project was not completed without him. He carefully read this paper, helped me with the English and corrected many errors. In order that I might acquire a doctor's degree, he had supported me for a long time.

Next I would like to thank Referee. He proposed that there exists a general framework from proofs of Theorem 3.3 and Corollary 3.4. As a result, we have Theorem 2.1, Theorem 2.2, and Proposition 2.3.
